

Summary (click me!)

General

Ice fields spawn in volatile storms in **HS**, **LS** and **NS**. 7 units of a particular space's ore (can't turn in ice from HS at a LS site for example) have to be traded at the belt's local Orca for a box of loot.

LS boxes are assumed to be the most valuable ones, followed by **NS** and then **HS**.

One can acquire upgraded boxes by turning in Cryograph- items (dropped by [Yoiul LADs](#)).

Space	Anomaly	Cryograph- item for upgraded boxes
HS	Fading Volatile Ice Field	Cryograph Diffractor
LS	Fresh Volatile Ice Field	Cryograph Resolver
NS	Friable Volatile Ice Field	Cryograph Extractor

Rocks in a particular anomaly respawn ONCE, 60 minutes after their initial depletion. This requires one ship to remain on grid after the belt has been initially mined out, otherwise the belt despawns. So, each ice anomaly can be mined twice, the entry in the probe window vanishes after the first depletion though.
